

Deepwater Drilling Risk & Status Overview

Risk categories, cases, locations, fields, wells, and campaigns

Project Report

Purpose: A simplified, structured overview of the supplied deepwater drilling risk/status information and its regional locations, fields, wells, and campaigns.

1. Deepwater Drilling Risk & Status Categories

Red (High Risk: Deepwater Hazards)

The Cases:	Ultra-deepwater wells facing subsea blowouts or gas hydrate strikes.
The Details:	Drilling 1,000 to 3,000 meters underwater involves extreme hydrostatic pressure. If a drill hits unstable gas hydrates (frozen methane), it causes rapid gas expansion. A broken subsea blowout preventer at this depth creates a catastrophic, hard-to-cap leak at the ocean floor.

Yellow (Mid Risk: Severe Weather & Logistics)

The Cases:	Floating drillships and semi-submersible rigs in the Bay of Bengal.
The Details:	These operations battle harsh annual cyclones and strong deep-ocean currents. Because ships must float miles above the wellhead, bad weather routinely forces emergency disconnects from the well, halting operations and costing millions.

Brown (Abandoned: Failed Exploration)

The Cases:	Legacy relinquished blocks originally drilled by Reliance Industries, alongside early exploratory dry holes by ONGC.
The Details:	Geologists spent millions drilling based on promising 3D seismic maps, only to discover the deep-sea rock was either too tight for gas to flow or the structures were completely flooded with subterranean water instead of hydrocarbons.

Green (Active & Successful: Current Discoveries)

The Cases:	The "Samudra Manthan" deepwater campaign, specifically ONGC's exploratory well MN-DW18-1-H-D (launched July 2026), and successful major gas discoveries like the Utkal, Konark, and MDW-4A fields.
The Details:	Powered by advanced 3D seismic modeling, drillers are successfully targeting and extracting multi-trillion cubic feet of continuous, gas-rich reservoir sands off the Odisha coast that were previously impossible to reach.

2. Broad Regional Locations

Mahanadi Basin: The primary geological region spanning the Odisha coastline.

Bay of Bengal: The overarching body of water where these deepwater and ultra-deepwater offshore operations take place.

3. Specific Fields and Discoveries

Utkal Field: A major deepwater gas discovery.

Konark Field: Another significant deep-sea gas discovery in the region.

MDW-4A Field: A legacy gas-bearing area off the coast.

4. Specific Wells and Campaigns

MN-DW18-1-H-D: The specific name of the recently launched deepwater exploratory well.

Samudra Manthan: The title of the specific deepwater exploration campaign/block operating in this basin.

For mapping these specific locations to your frontend or database, refer to the file named "What actually i have to do for my web".

5. Simplified Regional Relationship

Region / Basin	Offshore Area	Fields / Discoveries	Well / Campaign
Mahanadi Basin	Bay of Bengal / Odisha coast	Utkal, Konark, MDW-4A	MN-DW18-1-H-D
Deepwater campaign	Bay of Bengal / Odisha coast	Current deepwater discoveries	Samudra Manthan
