

ONSHORE OPERATIONS REPORT

Gujarat: Mevad Field & Surrounding Cambay Basin • September 2026

HIGH RISK Onshore Blowouts & Agricultural Impact

SCOPE:

Mevad field and Mehsana district blocks (High-pressure drilling).

DETAILS:

Shallow gas pockets paired with inadequate pressure control pose extreme risks. Potential for uncontrolled releases of crude oil and toxic gases threatens soil quality, groundwater, and human safety in nearby populated zones.

MID RISK Toxic Waste & Land Use Friction

SCOPE:

Mevad, Sobhasan, and Kalol fields (Dense extraction campaigns).

DETAILS:

Heavy operations generate massive volumes of spent cuttings and chemical mud. Challenges include regulatory strain for waste disposal and land-use disputes with local farming communities.

ABANDONED Depleted or Dry Wells

SCOPE:

West Mevad mining lease and Mehsana Asset legacy sites.

DETAILS:

Exploratory wells that missed commercial zones or hit water-bearing sands. Includes older wells exhausted of natural pressure, now permanently plugged and sealed.

SUCCESS Recent Discoveries & Active Production

SCOPE:

Mevad Field: NM-01 Well (Asian Energy Services partnership).

DETAILS:

Major success at 1,650m depth, striking rich hydrocarbon-bearing sands. Currently supplying high-quality crude to domestic refineries at ~130 barrels per day.

Developer Note: Map these status profiles and outcomes to the database/frontend architecture as specified in the "What actually i have to do for my web" reference document.
