

NANDEJ FIELD STATUS REPORT

Ahmedabad Asset • Gujarat Onshore

● HIGH RISK: Urban Proximity

THE CASES: High-pressure workovers & repairs in Nandej Field.

Located near Ahmedabad's expanding settlements. Any gas kick or blowout poses a high-severity threat to nearby local communities and urban infrastructure.

● MID RISK: Machinery Strain

THE CASES: Mature extraction wells (Nandej & Bareja).

High water levels in reservoirs require massive "nodding donkey" pumps. The intense strain frequently snaps pump rods, leading to expensive and constant repairs.

● ABANDONED: Watered-Out

THE CASES: Legacy production wells in Nandej mining lease.

Older wells where oil flow has been completely replaced by water. These sites are economically unviable and have been permanently plugged with cement.

● SUCCESS: Reliable Production

THE CASES: Active Artificial-Lift network.

A steady producer for ONGC. Through EOR techniques and successful mechanical pumping, the field continues to supply high-quality crude to regional refineries.
